

## SQL – Challenge

1. Create a table called Author. This table should have the columns Id, FirstName, LastName, Age. Pick the right datatype for each column.
2. Create a table called Book. This table should have the columns Id, Title, Pages, AuthorId. AuthorId should be a foreign key on the Id column of the Author table.
3. Insert an Author and 3 Books for this Author.
4. Select all columns from Author.
5. Join the Books using the foreign key and select all of their columns aswell.
6. Group the result by the Authors Id and only select the Authors FirstName and LastName along with the count of Books.
7. Select the amount of pages of all Books in the Groups
